

Chapter 3 Methodological Appendix

We omitted most descriptive statistics from Chapter 3, partially because many of the most interesting results that can be uncovered by these simple statistics are reported in Chapter 2. Below, in Table A3.1 we present the standard descriptive statistics for the variables included in the various models that follow as well as information on how we gathered this data.

Table A3.1: Descriptive Statistics

Variable	Mean	Std. Dev.	Min	Max
<i>Judicial Policy Preference</i>				
Asylum Liberalism	1.253	0.908	0.000	4.076
<i>US Material & Security Interests</i>				
Log of Trade with US	8.108	2.947	-2.207	13.262
US Military Aid	0.703	0.456	0	1
Top Ten Illegal Immigration	0.292	0.454	0	1

Detention Status	0.313	0.629	0	2

Modeling Results

In Chapter 3 we did not present the traditional table of results since the substantive effects of the variables are more interesting than the coefficients and their standard errors. Nevertheless, some readers may wish to see the results in full in order to assess the accuracy of our substantive

evaluations. To this end we present, in Table A3.2 the full specifications for each of the models we rely on in Chapter 3.

Table A3.2: Full Model Results

Variables	Random Intercept, 1990-2010	Random Intercept, 1999-2010	Stereotype Logit

Simple Model (No Interactions)

To facilitate easier interpretation, we have also included a version of the stereotype logit model shown above without any interactions. Table A3.3 displays the model coefficients, standard errors and marginal effects for each of the variables.

Table A3.3: Stereotype Logit, No Interactions

Variables	Coeff.	Robust S.E.	Marginal Effect

To further illustrate the unconditional effect of IJ ideology, we present Figure A3.1 below, demonstrating the change in the likelihood of a grant of asylum across the range of IJ asylum liberalism.

Figure A3.1: Unconditional Effect of IJ Ideology

Random Intercept Model Stability

One of the difficulties in estimating a model with a dichotomous dependent variable and a random intercept is that likelihood estimate for the model must be approximated. The recommended estimation strategy for this approximation is adaptive quadrature (Rabe-Hesketh and Skrondal 2012). The accuracy of adaptive quadrature depends on the number of integration points used in the approximation process, with large numbers of integration points leading to potentially more accurate estimates. To ensure that the random intercept models that we present in Chapter 3 are accurate to a reasonable degree of precision we estimated each of the models twice: once with one integration point (a Laplace estimation procedure) and then again with three integration points. Evidence for the stability of the estimations can be seen by comparing the change in the standard errors between different numbers of integration points. Little change between models with different numbers of integration points is evidence for stability. In Table A3.4 we present the results of these comparisons which demonstrate a comforting amount of stability in the estimates—there are no differences in the standard errors to three decimal places across the models.

Table A3.4: Model Stability Comparison

Variables	Model 1: Two-Level, Random Intercept; 1990-2010; 1 integration point	Model 1: Two-Level, Random Intercept; 1990-2010; 3 integration points

Data Sources

Below, in Table A3.5, we detail the sources for the data used to construct variables in this chapter and in most of the remaining empirical chapters. Actual sources are in the footnotes that accompany the table.

Table A3.5: Data Sources and Coding

Judicial Background
Gender and Career Socialization Data: The EOIR posts biographies of all new appointments to the bench, and while the biographies do not report gender, they do employ pronouns. To code career socialization or experience, presence of each characteristic was coded as a 1 and 0 if absent, based on our coding of EOIR biographies. ¹
U.S. Material & Security Interests
Total Trade (logged): Annual trade (the sum of bilateral exports and imports) between U.S. and the other country, logged. Source: Correlates of War Project Trade Data Set Codebook, Version 2.0. http://correlatesofwar.org . ²
Recipients of U.S. military aid: Annual dummy variable depicting whether country of origin was a recipient of U.S. aid. Source: USAID 2008. "U.S. Overseas Loan and Grants." http://quesdb.cdie.org/gbk/index.html . ³
Indicators of Bogus Asylum Seeker
Top Ten Undocumented Immigrant Countries: Dummy variable for the following countries: Mexico, El Salvador, Guatemala, Canada, Haiti, Philippines, Honduras, the Dominican Republic, Nicaragua, and Poland. Source: coded by Rottman, Fariss and Poe. ⁴
World Bank Development Level: The World Bank categorizes countries, based upon 1995 GDP per capita into four levels which we assign the following values: (1) low income, (2) lower-middle income, (3) upper-middle income, and (4) high income. Source: World Bank.
Human Rights Factors
Polity IV Level of Democracy: Our measure of democracy is drawn from the Polity IV data set operationalizes institutionalized democracy as an additive scale which evaluates the competitiveness of political participation in the country, the openness and competitiveness of executive recruitment, and the constraints which are placed on the chief executive. Upon the advice of the creators of the scale, we operationalize this measure trichotomously, with 0 representing autocracy, 1 representing anocracy, and 2 representing democracy. ⁵

<p>Political Terror Scale: The Political Terror Scale is composed of two scales: one based on human rights accounts in the annual reports of the U. S. Department of State and one based on Amnesty International's annual reports, each of which assess human rights conditions in almost all the world's nations. The rating scale ranges from 0 to 4, with 1 assigned to states with the lowest, and 4 to states with the highest, levels of personal integrity abuse. The categories are as follows: (0) countries under a secure rule of law, people not imprisoned for their views, torture is rare or exceptional and political murders are rare; (1) a limited amount of nonviolent political activity, with few persons affected, torture and beating exception; (2) extensive recent history of political imprisonment, with execution or other political murder common and unlimited detention for political views accepted; (3) level 2 terror expanded to whole population with no limits on leaders' pursuit of goals.⁶</p>
